Cole's first appearance at Wizard Magazine'''s American Showcase event Category:Magic consultants Category:American magicians Category:1953 births Category:Living people Category:People from Broadview Heights, OhioQ: Accessing a character which changes before function call I have a string that contains a character c. Before I call a function, I need to be able to know if this character is "c" or not. Is there a way of doing this without storing this information somewhere or do I have to add this information to the string? string str = "c"; if (str[0] == 'c') return true; else return false; A: There is no function which returns a boolean true or false for a string. This is because a string is not an integer, not a boolean. You can do the following: if(str.size() > 0 && str[0] == 'c') { // the character is c } // not c or if(str.size() > 0 && str[0] == 'c' && str[1] == 'c') // The character sequence is ccc else 82157476af
